SIDHO-KANHO-BIRSHA UNIVERSITY

PURULIA, WEST BENGAL

SYLLABUS

for

M.Sc. in MATHEMATICS

Four Semesters

Effective from the academic session 2011 -2012 and onwards

SIDHO-KANHO-BIRSHA UNIVERSITY
PURULIA, WEST BENGAL

Syllabus For M.Sc. in Mathematics

Duration of P.G. course of studies in Mathematics shall be two years with Semester-I, Semester-Il, Semester-III and Semester-IV each of six months duration leading to Semester-I, Semester-Il, Semester-III and Semester-IV examination in Mathematics at the end of each semester. Syllabus for P.G. courses in Mathematics is hereby framed according to the following schemes and structures.

Scheme: Total Marks = 1000 with 250 Marks in each semester comprising of five papers in each semester with 50 marks in each paper. In each theoretical paper 10% Marks is allotted for Internal Assessment. There are four theoretical papers and one practical paper in Semester-II. All students admitted to P.G. course in Mathematics shall take courses of Semester-I and Semester-Il. In Semester-III, the first three papers are general and the last two papers are special papers. In IV, the first two papers are general and the next two papers are special papers and the fifth paper is the term paper. In the Semester-III and Semester-IV, the Department will offer a cluster of special papers and the students will have to choose one according to the norms to be decided by the Department. The term paper is related with the respective special papers and the mark distribution is 20 for written submission, 20 for Seminar presentation and 10 for Viva-Voice. It should be noted that some special papers will be included in future as per discretion of the Department.

COURSE STRUCTURE
SEMESTER STRUCTURE OF M.A./M.SC. SYLLABUS IN MATHEMATICS
(SEMESTER-I, II, III, IV)

SEMESTER-I

Duration: 6 Months

Total Marks: 250

Total No. of Lectures: 50 Hours per paper

Each Theoretical Paper Containing 45 Marks and 5 Marks for Internal Assessment

Paper	Topics	Marks
MG101:	A: Functional Analysis (27+3)	30
	B: Real Analysis-I (18+2)	20
MG102:	A: Linear Algebra (27+3)	30
	B: Modern Algebra-I (18+2)	20
MG103:	A: Elements of General Topology (27+3)	30
	B: Complex Analysis-I (18+2)	20
MG104:	A: Ordinary Differential Equations & Special Functions (27+3)	30
	B: Operations Research-I (18+2)	20
MG105:	A: Principle of Mechanics-I (27+3)	30
	B: Numerical Analysis (18+2)	20

SEMESTER-II

Duration: 6 Months

Total Marks: 250

Total No. of Lectures: 50 Hours per paper

Each Theoretical Paper Containing 45 Marks and 5 Marks for Internal Assessment

Paper	Topics	Marks
MG201:	A: **Complex Analysis-II (27+3)**	**30**
	B: Real Analysis-II (18+2)	**20**
MG202:	**A: Partial Differential Equations (27+3)**	**30**
	B: Differential Geometry (18+2)	**20**
MG203:	**A: Operations Research-II (27+3)**	**30**
	B: Principle of Mechanics-II (18+2)	**20**
MG204:	**A: Computer Programming (27+3)**	**30**
	B: Continuum Mechanics-I (18+2)	**20**
MG205:	**Computer Aided Numerical Practical**	**50**

SEMESTER-III

Duration: 6 Months

Total Marks: 250

Total No. of Lectures: 50 Hours per paper

Each Theoretical Paper Containing 45 Marks and 5 Marks for Internal Assessment

Paper	Topics	Marks
MG301:	A: BVPs, Green Function & Calculus of Variation (27+3)	30
	B: Modern Algebra-II (18+2)	20
MG302:	A: Integra Transforms And Integral Equations (27+3)	30
	B: Graph Theory (18+2)	20
MG303:	A: General Topology (27+3)	30
	B: Elementary Fuzzy Set Theory (18+2)	20
MS304:	Special Paper-I (45+5)	50
MS305:	Special Paper-II (45+5)	50

SEMESTER-IV

Duration: 6 Months

Total Marks: 250

Total No. of Lectures: 50 Hours per paper

Each Theoretical Paper Containing 45 Marks and 5 Marks for Internal Assessment

Paper	Topics	Marks
MG401:	A: Probability and Statistical Methods (27+3)	30
	B: Modern Algebra-III (18+2)	20
MG402:	A: Continuum Mechanics-II (27+3)	30
	B: Elements of Dynamical System (18+2)	20
MS403:	Special Paper-III (45+5)	50
MS404:	Special Paper-IV (45+5)	50
MT405:	Term Paper (20+10+10)	50

Term Paper MT405 is related with the Special papers and the Marks distribution is 20 Marks for written submission and 20 Marks for Seminar Presentation and 10 Marks for Viva-Voce.

Cluster of Special Paper-I For Semester-III & Paper- II For Semester –IV respectively each of 50 marks :

1. Advanced Differential Geometry-I & II
2. Advanced Real Analysis-I & II
3. Advanced Functional Analysis-I & II
4. Rings of Continuous Function-I & II
5. Theory of Rings and Algebra-I & II
6. Non-linear Optimization in Banach Spaces-I & II
7. Harmonic Analysis-I & II
8. Measure and Integration- I & II
9. Operator Theory and Applications- I & II
10. Algebraic Topology- I & II
11. Lattice Theory-I & II
12. Geometric Functional Analysis- I & II
13. Cryptography- I & II
14. Advanced Complex Analysis- I & II

15. Viscous Flows, Boundary Layer Theory and Magneto Hydrodynamics-I & II

16. Elasticity-I & II

17. Elasticity and Theoretical Seismology-I & II

18. Applied Functional Analysis -I & II

19. Quantum Mechanics- I & II

20. Advanced Operations Research- I & II

21. Inviscid Compressible Flows and Turbulence- I & II

22. Computational Fluid Dynamics- I & II

23. Mathematical Modelling of Biological System I & II

24. Computational Biology I & II

25. Plasma Mechanics I & II

26. Advaanced Fuzzy Sets & Systems I & II

Note : (i) **All the students will have to take two Special Papers in Semester-III and two Special Papers in Semester- IV from the clusters of special papers.**

(ii) The allocation of special papers will be monitored by the Department.

DETAILED SYLLABUS

SEMESTER-I

Paper – MG101

(Functional Analysis & Real Analysis-I) 7

Group : A

Functional Analysis

Total Lectures : 40 **(Marks – 30)**

Baire category theorem. Normed linear spaces, continuity of norm function, Banach spaces, Spaces $\mathbf{C}^n$, C [a,b] (with supmetric), c_0, l_p $(1 \leq p \leq \infty)$ etc; (10L)

Linear operator, boundedness and continuity, examples of bounded and unbounded linear operators. (10L)

Banach contracton Principle – application to Picard's existence theorem and Implicit function theorem. (8L)

Inner product, Hilbert spaces, examples such as l_2 spaces, $L_2[a,b]$ etc; C-S inequality, Parallelogram law, Pythagorean law, Minkowski inequality, continuity and derivatives of functions from $\mathbf{R}^m$ to $\mathbf{R}^n$. (12L)

Group : B

Real Analysis-I

Total Lectures : 25 **(Marks – 20)**

Monotone functions and their discontinuities, Functions of bounded variation on an interval, their properties, Riemann-Stieltjes integral, existence, convergence problem and other properties. (12L)

Lebesgue outer measure, countable subadditivity, measurable sets and their properties, Lebesgue measure, measurable functions, equivalent functions, continuity and measurability, monotonocity and measurability, operation on collection of measurable functions, pointwise limit of a sequence of measurable functions, measurability of Supremum and Infimum, simple function and measurable function. (13L)

Paper – MG102

(Linear Algebra & Modern Algebra-I)

Group : A

Linear Algebra

Total Lectures : 40 **(Marks – 30)**

Vector spaces, Euclidean space, Unitary space, orthonormal basis, Gram-Schmidt orthogonalization process. (8L)

Linear transformation in finite dimensional spaces, matrix of linear, rank and nullity, annihilator of a subset of a vector space. (5L)

Eigen vectors, spaces spanned by eigen vectors, similar and congruent matrices, characteristic polynomial, minimal polynomial, diagonalization, diagonalization of symmetric and Hermitian matrices, Cayley-Hamilton theorem, reduction of a matrix to normal form, Jordan Canonical form. (17L)

Quadratic form, Reduction to normal form, Sylvester's law of inertia, simultaneous reduction of two quadratic forms, applications to Geometry & Mechanics. (10L)

Group : B

Modern Algebra -I

Total Lectures : 25 **(Marks – 20)**

Groups: Homomorphism, Isomorphism of groups, First and second isomorphism theorems, automorphisms and automorphism group, Inner automorphisms, groups of order 4 and 6, Normal sub groups and correspondence theorem for groups, simple groups. (10L)

Rings : Ring, commutative rings with identity, Prime & irreducible elements, division ring, Quaternions, idempotent element, Boolean ring, ideals, Prime ideal, maximal ideal, Isomorphism theorems, relation between Prime and maximal ideal, Euclidean domain, Principal ideal domain, Unique factorization domain, Polynomial rings. (15L)

Paper – MG103

(Elements of General Topology & Complex Analysis-I)

Group : A
Elements of General Topology

Total Lectures : 40 **(Marks – 30)**

Topological spaces; definition, open sets, closed sets, closure, denseness, neighbourhood, interior points, limit points, derived sets, basis, subbasis, subspace. (10L)

Alternative way of defining a topology using Kuratowski closure operators and neighbourhood systems. (5L)

Continuous functions, homeomorphism and topological invariants. (3L)

First and second countable spaces, Lindelöf spaces, separable spaces and their relationship.(8L)

Separation axioms: T_0, T_1, T_2, T_3, $T_{3½}$, T_4 spaces, their simple properties and their relationship. (8L)

Introduction to connectedness and compactness. (6L)

Group : B

Complex Analysis -I

Total Lectures : 25 **(Marks – 20)**

Complex Integration, line integral and its fundamental properties, Cauchy's fundamental theorem, Cauchy's integral formula and higher derivatives, power series expansion of analytic functions.(14L)

Zeros of analytic functions and their limit points, entire functions, Liouville's theorem. Fundamental theorem of algebra.(6L)

Simply connected region and primitives of analytic functions, Morera's theorem. (5L)

Paper – MG104

(Ordinary Differential Equations & Special Functions, Operations Research-I)

Group : A
Ordinary Differential Equations & Special Functions

Total Lectures : 40 **(Marks – 30)**

Ordinary Differential Equations

First order system of equations: Well-posed problems, existence and uniqueness of the solution, simple illustrations. Peano's and Picard's theorems (statements only) (8L)

Linear systems, non-linear autonomous system, phase plane analysis, critical points, stability, Linearization, Liapunov stability, undamped pendulum, Applications to biological system and ecological system (12L).

Special Functions

Series Solution : Ordinary point and singularity of a second order linear differential equation in the complex plane; Fuch's theorem, solution about an ordinary point, solution of Hermite equation as an example; Regular singularity, Frobenius' method – solution about a regular singularity, solutions of hypergeometric, Legendre, Laguerre and Bessel's equation as examples.(10L)

Legendre polynomial : its generating function; Rodrigue's formula, recurrence relations and differential equations satisfied by it; Its orthogonality, expansion of a function in a series of Legendre Polynomials.(6L)

Adjoint equation of n-the order: Lagrange's identity, solution of equation from the solution of its adjoint equation, self-adjoint equation, Green's function.(4L)

Group : B

Operations Research-I

Total Lectures : 25 **(Marks – 20)**

Introduction, Definition of O.R., Drawbacks in definition, Scope of O.R., O.R. and decision making, Application of O.R. in different sectors, Computer application in O.R.(3L)

Fundamental theorem of L.P.P. along with the geometry in n-dimensional Euclidean space (hyperplane, separating and supporting plane).(3L)

Standard forms of revised simplex method, Computational procedure, Comparison of simplex method and revised simplex method, Sensitivity analysis, Bounded variable method, The Primal Dual Method.(14L)

Mathematical formulation of Assignment Problem, Optimality condition, Hungarian method, Maximization case in Assignment problem, Unbalanced Assignment problem, Restriction on Assignment, Travelling salesman problem.(5L)

Paper – MG105

(Principle of Mechanics-I & Numerical Analysis)

Group : A

Principle of Mechanics-I

Total Lectures : 40 **(Marks – 30)**

Generalised co-ordinates: Degrees of freedom, Constraint, Principle of Virtual Work. Lagrangian formulation of Dynamics: Lagrange's equations of motion for holonomic and non-holonomic systems. Ignoration of coordinates. (10L)

Routh's processs for the ignoration of co-ordinates. Rayleigh's dissipation function. Calculus of variation and Euler-Lagrange differential equations. Brachistochrone problem. (10L)

Configuration space and system point. Hamilton's principle; Hamilton's cannocical equations of motion. Principle of energy.(10L)

Principle of least action, Canonical Transformations, Poisson Bracket. (10L)

Group : B

Numerical Analysis

Total Lectures : 25 **(Marks – 20)**

Numerical Methods : Algorithm and Numerical stability. (2L)

Graffae's root squaring method and Bairstow's method for the determination of the roots of a real polynomial equation. (4L)

Polynomial Approximation : Polynomial interpolation; Errors and minimizing errors; Tchebyshev polynomials; Piece-wise polynomial approximation. Cubic splines; Best uniform approximations, simple examples. (4L)

Richardson extrapolation and Romberg's integration method; Gauss' theory of quadrature. Evaluation of singular integral. (4L)

Operators and their inter-relationships : Shift, Forward, Backward, Central differences; Averaging operators, Differential operators and differential coefficients.(2L)

Initial Value Problems for First and Second order O.D.E. by

(i) 4th order R – K method

(ii) RKF_4- method

(iii) Predictor – Corrector method by Adam-Bashforth, Adam-Moulton and Milne's method. (3L)

Boundary value and Eigen-value problems for second order O.D.E. by finite difference method and shooting method. (3L)

Elliptic, parabolic and hyperbolic P.D.E. (for two independent variables) by finite difference method; Concept of error, convergence & numerical stability. (3L)

SEMESTER-II

Paper – MG201

(Complex Analysis-II & Real Analysis-II)

Group : A

Complex Analysis-II

Total Lectures : 40 **(Marks – 30)**

Open mapping theorem.(5L)

Singularities. Laurent's series expansion and classification of isolated singularities, essential singularities and Casorati-Weierstrass's theorem. Cauchy's residue theorem and evaluation of improper integrals.(12L)

Argument principle, Rouche's theorem and its application.(5L)

Maximum modulus theorem.(3L)

Conformal mappings, Schwarz's Lemma and its consequence.(10L)

Introduction to Analytic continuation.(5L*)*

Group : B

Real Analysis-II

Total Lectures : 25 **(Marks – 20)**

Lebesgue integral of a simple function, Lebesgue integral of a non-negative (bounded or unbounded) measurable function, Integrable functions and their simple properties, Lebesgue integral of functions of arbitrary sign, Integrable functions, basic properties of the integral, Integral of point wise limit of sequence of measurable functions- Monotone convergence theorem and its consequences, Fatou's lemma, Lebesgue dominated convergence theorem. Comparison of Lebesgue's integral and Riemann integral, Lebesgue criterion of Riemannian integrability. (17L)

Fourier series, Dirichlet's kernel, Riemann-Lebesgue theorem, Pointwise convergence of Fourier series of functions of bounded variation. (8L)

Paper – MG202

(Partial Differential Equations & Differential Geometry)

Group : A

Partial Differential Equations

Total Lectures : 40 **(Marks – 30)**

General solution and complete integral of a partial differential equation; Singular solution; Integral surface passing through a curve and circumscribing a surface.(4L)

First order P.D.E, : Characteristics of a linear first order P.D.E.; Cauchy's problem; Solution of non-linear first order P.D.E. by Cauchys method of characteristics; Charpit's method (application only).(8L)

Second order linear P.D.E. : Classification, reduction to normal form; Solution of equations with constant coefficients by (i) factorization of operators, (ii) separation of variables; Solution of one-dimensional wave equation and diffusion equation; Solution of Laplace equation in Cylindrical and spherical polar co-ordinates. Formulation of Initial and Boundary Value Problem of P.D.E; Solution of Dirichlet's and Numann's problem of Laplace's equation for a circle.(28L)

Group : B

Differential Geometry

Total Lectures : 25 **(Marks – 20)**

Reciprocal base system, Intrinsic derivative, Parallel vector field along a curve Space Curve, Serret – Frenet formula. (8L)

Metric tensor of the surface, angle between two curves lying on the surface, parallel vector field on a surface, Geodesics on a surface, Its differential equation, Geodesic curvature of a surface curve, Tensor derivative. (10L)

First fundamental form of the surface, Gauss's formula and second fundamental form of the surface, Meusnier theorem and Euler's theorem. (7L)

Paper – MG203

(Operations Research-II & Principle of Mechanics-II)

Group : A
Operations Research-II

Total Lectures : 40 **(Marks – 30)**

Deterministic Inventory control Models: Introduction, Classification of Inventories, Advantage of Carrying Inventory, Features of Inventory System, Deterministic inventory models including price breaks.(14L)

Standard form of Integer Programming, The concept of cutting plane, Gomory's all integer cutting plane method, Gomory's mixed integer method, Branch and Bound method.(10L)

Processing of n jobs through two machines, The Algorithm, Processing of n jobs through m machines, Processing of two jobs through m machines.(6L)

Project scheduling by PERT/CPM : Introduction, Basic differences between PERT and CPM, Steps of PERT/CPM Techniques, PERT/CPM network Components and Precedence Relationships, Critical Path analysis, Probability in PERT analysis, Project Crashing, Time cost Trade-off procedure, Updating of the Project, Resource Allocation.(10L)

Group : B
Principle of Mechanics-II

Total Lectures : 25 **(Marks – 20)**

Theory of small oscillations. Normal co-ordinates. Euler's dynamical equations of motion of a rigid body about a fixed point. Torque free motion. Motion of a top on a perfectly rough floor. Stability of top motion. Motion of a particle relative to rotating earth. Foucault's pendulum.(20L)

Special Theory of Relativity : Postulates; Special Lorentz Transformation ; Fitz-Gerald contraction and time-dilation. Einstein's velocity addition theorem. Relativistic mechanics of a particle, Energy equation $E = mc^2$. (5L)

Paper – MG204
(Computer Programming & Continuum Mechanics-I)

Group : A
Computer Programming

Total Lectures : 40 **(Marks – 30)**

Structured Programming in FORTRAN – 77: DATA, COMMON, EQUIVALENCE, EXTERNAL statements. Function and subroutine subprograms;

Following simple Programs in FORTRAN – 77 are to be studied

1) Largest number from a set of n numbers.
2) Arrange n numbers in ascending/descending order
3) Sum/multiplication of arrays
4) Matrix: Trace of a square matrix, Transpose of a matrix, Addition, Multiplication
5) Sum of simple series, Hypergeometic series, $J_0(x)$
6) Evaluate a function for a given *x* using Statement Function.
7) Find Binomial Coefficient using Function Subprogram.
8) Find Binomial Coefficient using Subroutine Subprogram. (20L)

Programming in C:

Introduction, Basic structures, Character set, Keywords, Identifiers, Constants, Variable-type declaration,

Operators : Arithmetic, Relational, Logical, assignment, Increment, decrement, Conditional.

Operator precedence and associativity, Arithmetic expression,

Statement : Input and Output, Define, Assignment, User define.

Decision making (branching and looping) – Simple and nested IF, IF – ELSE, LADDER, SWITCH, GOTO, WHILE – DO, FOR, BREAK AND CONTINUE Statements.

Arrays- one and two dimensions, user defined functions, Concatenation. (20L)

Group : B

Continuum Mechanics-I

Total Lectures : 25 **(Marks – 20)**

Continuous media, Deformation, Lagrangian and Eulerian approach; Analysis of strain (infinitesimal theory);.(7L)

Analysis of stress; Invariants of stress and strain tensors. Principle of conservation of mass; Principle of balance of linear and angular momentum; Stress equation of motion. (11L)

Necessity of constitutive equations. Hooke's law of elasticity, displacement equation of motion. Newton's law of viscosity (statement only). (7L*)*

Paper – MG205

Computer Aided Numerical Practical

Total Practical Classes : 65 **(Marks – 50)**

(Numerical Practical Using FORTRAN – 77)

(Viva to be conducted on Paper – MG204 & MG205 only)

Sessional (Working formula, Algorithm and Program with output): 10 marks

Problem 1 (from Sessional): 25 marks (Working formula--5, Algorithm – 5, Program – 10, Result – 5)

Problem 2 (Simple unknown): 10 marks (Program – 5, Result – 5)

Viva-voce: 5 marks

1. Inversion of a non-singular square matrix by Gauss-Jordan Method.
2. Solution of a system of linear equations by Gauss–Seidel method.
3. Integration by Romberg's method.
4. Solution of an Initial Value problem of first order O.D.E. by Milne's method.
5. Solution of an Initial Value problem of second order O.D.E. by 4th order Runge–Kutta method.
6. B.V.P. for second order O.D.E. by finite difference method.
7. Solution of parabolic equation in two variables by two layer explicit Schmidt formula.
8. Solution of one dimensional wave equation by finite difference method.

SEMESTER-III

Paper – MG301

Group A

BVPs, Green Function & Calculus of Variation

Total Lectures : 50 **(Marks – 30)**

BVPs & Green Function

Linear ordinary differential equations; generalized solution, fundamental solution, inverse of a differential operator. Two-point boundary value problem for a second-order linear O.D.E. Green's functions and its bilinear expansion, particular integral, Analogy between linear simultaneous algebraic equations and Linear differential equation. (6L)

Mathematical models and initial boundary value problems of 2^{nd} order partial differential equation (PDE); wellposedness; necessity of classification and canonical forms. Invariance of nature of an equation and its characteristics under coordinate transformation; transformation of semilinear 2^{nd} order PDE in two independent variables; linear transformations, and linear PDE's with more than two independent variables. (5L)

Linear hyperbolic PDE's in two independent variables Cauchy problem. Cauchy-Kowalasky theorem (statement only) reason for restriction on cauchy ground curve. Rieman-Green function. Domain of dependence and influence. Possible discontunuites of solutions; d'Alemberts solution and meaning of generalized solution. (6L)

Linear parabolic equations : Heat equation in two independent variables, solution of Cauchy problem using Dirac Delta function and Fourier transform, maximum principle for initial – boundary value (for Dirichlet boundary condition) problem, uniqueness and stability of solution.

Methods of Eigen function empansion and Green's function; Separation of variables, formulation of eigenvalue problems related to wave, heat and Laplace equations. (8L)

Linear elliptic equation: Laplace equation : boundary value problems of Dirichlet, Neumann and Robin. Greens formulas involving Laplacian; mean value theorem, maximum principle, uniqueness and stability of solutions; Dirichlet principle, Rayleigh-Ritz method. (5L)

Greens function for Dirichlet problem on Laplace eqn. its properties and methods of construction. Method of images. Method of conformal mapping for 2-dimentional problem with problem of a unit circle as an

example. Bilinear expansion for Green's funcion; Green's function for heat equation by the method of Eigen function expansion and Bilinear expansion for Dirac Delta function. (10L)

Calculus of Variations

Variation of a functional, Euler-Lagrange equation, Necessary and sufficient conditions for extrema. Variational methods for boundary value problems in ordinary and partial differential equations. (10L)

Group B

Modern Algebra-II

Total Lectures : 30 **(Marks – 20)**

***Groups* :** Direct product (internal and external), Group action on a set, Conjugacy classes and conjugacy class equation, p-groups, Cauchy's theorem, converse of Lagrange's theorem for finite commutative groups, Syllow theorems and applications, Normal series, solvable series, solvable and Nilpotent groups, Jördan-Holder Theorem, Finitely generated Abelian groups, Free Abelian groups. (15L)

***Rings* :** Unique factorization domain; Factorization of polynomials over a field; Maximal, Prime and primary ideal; Noetherian and Artinian Rings; Hilbert basis theorem. (15L)

Paper – MG302

Group A

Integral Transforms & Integral Equations

Total Lectures :40 **(Marks – 30)**

Integral Transforms

Laplace transforms: Definition and properties. Laplace Transform of some elementary functions. Laplace transform of the derivatives. Inverse of Laplace transform. Bromwich Integral Theorem. Convolution theorem. Applications. (7L)

Fourier Transforms: Fourier integral Theorem. Definition and properties. Fourier transform of the derivative. Derivative of Fourier transform. Fourier transforms of some useful functions. Fourier cosine and sine transforms. Inverse of Fourier transforms. Convolution. Properties of convolution function. Convolution theorem. Applications. (7L)

Mellin's Transform: Properties of Mellin's transform. Inversion theorem, Convolution theorem, Application of Mellin' s transform. (3L)

Integral Equations

Linear Integral Equation, Reduction of differential equation to integral equation, Existence, Uniqueness and iterative solution of Fredholm and Volterra Integral equations; examples, Solution of Fredholm integral equation for degenerate kernel; Examples, Faltung type(closed cycle type) integral equation, Singular integral equation; Solution of Abel's integral equation. (20L)

10. *Linear Integral Equations*- S. G. Michelins.
11. *Linear Integral Equations*- R. P. Kanwal.

Group B

Graph Theory

Total Lectures : 40 **(Marks – 20)**

Graph, Subgraph, Complement, Isomorphism, Walks, Paths, cycles, connected components, Cut vertices and cut edges, Distance, radius and center, Diameter, Degree sequence, Havel-Hakimi Theorem (Proof not require) and its application (6L)

Trees, Centres of trees, Spanning trees, Eulerian and Semi Eulerian Graphs. Hamiltonian Graphs. (8L)

Vertex and edge connectivities, (6L)

Chromatic number, Bipartite graph. Broke's Theorem, Mycielski Construction, Chromatic polynomial, edge colouring number, König Theorem. (6L)

Adjacency matrix, Incidence matrix, Cycle rank and co-cycle rank, Fundamental Cycles with respect to Spanning tree and Cayley's theorem on trees. (5L)

Planar graphs, Statement of Kuratowski Theorem, Isomorphism properties of graphs, Eulers formula, 5 colour theorem. Statement of 4 colour theorem, Dual of a planar Graph. (6L)

Directed Graph, Binary relations, directed paths, fundamental Circuits in Digraphs, Adjacency matrix of a Digraph. (3L)

4. K. R. Pathasarthy – *Basic Graph Theory* (TMH., 1994).

Paper – MG303

Group A

General Topology

Total Lectures : 40 **(Marks – 30)**

Definition and examples of topological spaces. Basis as a neighborhood system for a given topology, sub-base, Open and Closed sets and related concepts. Continuous, open, closed mappings, examples and counter examples, Pasting lemma. Homeomorphism and topological invariants. (6L)

Subspaces of topological spaces, finite and infinite products products, metric topology.(4L)

The countability axioms, Separation axioms, Urysohn lemma and Tietzes extension theorem (Statements only) and some of their applications. (5L)

Connectedness : Examples, various characterizations and basic properties. Connectedness on the real line. Components and quasi components. Path connectedness and path components.(5L)

Compactness : Characterizations and basic properties of compactness, Lebesgue number lemma. Sequential compactness, BW Compactness and countable compactness. Local compactness and Baire Category Theorem. (6L)

Identification spaces: Constructing a Mobius strip, projective plane. (4L)

Group : B

Elements of Fuzzy Set Theory

Total Lectures : 25 **(Marks – 20)**

***Fuzzy Sets*:** Basic concepts of fuzzy sets, membership functions, interval valued fuzzy sets, type 2 fuzzy sets, alpha-cuts and their properties, convex fuzzy sets, extension principle, standard operations on fuzzy sets. (8L)

***Fuzzy numbers*:** Definition, triangular and trapezoidal fuzzy numbers, linguistic variables,

arithmetic operations on fuzzy numbers, solution of fuzzy equations. (5L)

Fuzzy relations: Basic concepts, binary fuzzy relations, membership matrices, sagittal diagram, max-min composition, relational join, transitive closure, fuzzy equivalence relations, fuzzy compatibility relations, fuzzy ordering relations. (5L)

***Application*:** Simple Optimization problems. (2L)

References

1. Fuzzy set theory and its applications: *H.-J. Zimmermann.*
2. First Course on Fuzzy Theory and Applications: *K.H. Lee*.
3. Fuzzy Sets and Fuzzy Logic: *G.J. Klir & B. Yuan*.
4. Fuzzy Sets, Fuzzy Logic, Applications: *G. Bojadziev & M. Bojadziev*.
5. Fuzzy Sets and Fuzzy Logic*: M Ganesh*.

Paper – MS304
(Special Paper-I)

Total Lectures : 65 **(Marks – 50)**

1: Advanced Differential Geometry-I

2: Advanced Real Analysis-I

Upper and lower limits of real function and their properties. (5L)

Pointwise differentiation of functions of linear intervals. Derivates and derivatives. Measurability of derivates. Differentiation of real functions. Dini derivates and their properties. Monotonicity theorem. Example of a continuous nowhere differentiable function. (30L)

Vitali's covering theorem in one dimension. Differentiability of monotone functions. Absolutely continuous functions and singular functions. Cantor ternery set and Cantor function. Indefinite Lebesgue Integral. Fundamental theorem of integral calculus for Lebesgue integral. Lusin's condition (N). Characterization of absolutely continuous functions (Banach-Zaricki theorem). (30L)

References :

6. I. P. Natanson – Theory of Functions of a Real Variable, Vols. I & II.
7. E. W. Hobson – Theory of Functions of a Real Variable, Vols. I & II

3: Advanced Functional Analysis-I

Topological vector spaces, Local base and its properties, Separation properties, Locally compact topological vector space and its dimension. Convex Hull and representation Theorem, Extreme points, Symmetric sets, Balanced sets, absorbing sets, Bounded sets in topological vector space. Linear operators over topological vector space, Boundedness and continuity of Linear operators, Minkowski functionals, Hyperplanes, Separation of convex sets by Hyperplanes, Krein-Milman Theorem on extreme points. (30L)

Locally convex topological vector spaces, Criterion for normability, Seminorms, Generating family of seminorms in locally convex topological vector spaces. Barreled spaces and Bornological spaces, Criterion for Locally convex topological vector spaces to be (i) Barreled and (ii) Bornological. (15L)

Strict convexity and Uniform convexity of a Banach space. Uniform Convexity of a Hilbert Space. Reflexivity of a uniformly convex Banach space, Weierstrass approximation theorem in C[a,b] (20L)

4: Rings of Continuous Function-I

The ring C(X) of the real valued continuous function on a topological space X, its subrings, the subring $C^*(X)$, their Lattice structure, ring homomorphisms and lattice homomorphism.(15L)

Zero-sets cozero-sets, their unions and intersection, completely separated sets, C^* -embedding, Urysohn's extension theorem and C-embedding. Pseudocompactness and internal characterization of Pseudocompact spaces.(15L)

Ideals, Z-filters, maximal ideals, prime ideals, prime filters and their relation.(5L)

Completely regular spaces and the zero-sets, weak topologies determined by C(X) and $C^*(X)$. Stone-Čech's therem concerning adequacy of Tychonoff spaces X for investigation of C(X) and $C^*(X)$, compact subsets and C – embedding, locally compact spaces and their properties.(10L)

Convergence of Z – filters, cluster points, prime Z – filters and convergence and fixed Z-filters.(5L)

Fixed ideals and compactness, fixed maximal ideals of C (X) and $C^*(X)$, their characterizations, the residue class rings modulo fixed maximal ideals in C(X) and $C^*(X)$ and the field of reals. Relation between fixed maximal ideals in C(X) and $C^*(X)$. Compactness and fixed ideals.(10L)

P- spaces, P-points and their properties, characterization of P-spaces, properties of P-spaces.(5L)

5: Theory of Rings And Algebras-I

Rings and Ideals : Definitions, Ideal. Quotient rings and homorphisms, The field of quotients, Minimal and maximal conditions, Primary decomposition, Polynomial rings. (15L)

The Classical Radical : Nilpotent ideals and the radical, The radical of related rings, Artinian & Noethrian rings, Direct sum decompositions, Ideals in semisimple rings, Matrix rings, The Wedderburn theorem. (20L)

Modules : Preliminaries, Direct sums and free modules, projective modules, Tensor products, field and matrix representations, Algebras. (20L)

The Jacoson Radical : Primitive rings, The Density Theorem, Structure theorems. (10L)

6: Non Linear Optimization In Banach Spaces-I

Review of Weak Convergence in normed spaces, reflexivity of Banach spaces, Hahn-Banach theorem and partially ordered linear spaces. (20L)

Existence Theorems for Minimal Points –Problem formulation. Existence theorems. Set of minimal points. (15L)

Applications to approximations and optimal control problems. (15L)

Generalised Derivatives-Directional derivative. Gâteaux and Frechet derivatives. Subdifferential. Quasidifferential Clarke derivative. (15L)

3. A. V. Balakrishnan – *Applied Functional Analysis* (Springer-Verlag)

7: Harmonic Analysis-I

Basic properties of topological groups, subgroups, quotient groups and connected groups. Discussion of Haar Measure without proof on R, T, Z, and some simple matrix groups. $L^1(G)$ and convolution with special emphasis on $L^1(R)$, $L^1(T)$, $L^1(Z)$. Approximate identities. (20L)

Fourier series. Fejer's theorem. The classical kernels. Fejer's Poisson's and Dirichlet's summability in norm and point wise summability. Fatou's Theorem. The inequalities of Hausdorff and Young. (20L)

Examples of conjugate function series. The Fourier transform. Kernels of R. The Plancherel theorem on R Planchere measure on R, T, Z. Maximal ideal space of $L^1(R)$, $L^1(T)$ and $L^1(Z)$. (25L)

5. R. R. Goldberg – *Fourier transforms*
6. T. Huissain – *Introduction to topological groups*

8: Measure and Integration-I

Algebra and σ-algebra of sets. Monotone class of sets. Borel sets. Fσ and Gδ sets. Countably additive set function. Measure on σ – algebra. Outer measure and measurability. Extension of measures. Complete measures and completion of a measure space. Construction of outer measures. Regular outer measure. Lebesgue Stieltjes measures and distribution function. Example of non-measurable sets (Lebesgue). (30L)

Measurable functions. Approximation of measurable functions by simple functions. Egoroff's Theorem. Lusin's Theorem. Convergence in measure. Integrals of simple functions. Integral of measurable functions. Properties of Integrals and Integrable functions. Monotone convergence theorem. Fatou's Lemma, Dominated convergence Theorem, Vitali convergence theorem. (35L)

9. I. P. Natanson – *Theory of Functions of a Real Variable*, Vols. I & II.
10. Charles Schwartz- Measure , Integration and Function spaces, World Scientific Publi., Singapore, 1994.

9: Operator Theory And Applications-I

Adjoint operators over normed linear spaces; their algebraic properties. Compact operators on normal linear spaces, Sequence of Compact operators, Compact extensions, Weakly compact-operators(10L)

operator equation involving compact operators, Fredholm alternative; Adjoint operators on Hilbert-spaces, Self-adjoint operators, their algebraic properties; Unitary operators, normal operators in Hilbert spaces, positive operators, their-sum, product; Monotone sequence of positive operators, square-root of positive operator, Projection operators. (20L)

Their sum and product; Idempotent operators, positivity norms of Projection operators; Limit of monotone increasing sequence of Projection operators. (35L)

10: Algebraic Topology-I

Homotopy : Definition and some examples of homotopies, homotopy type and homotopy equivalent spaces, retraction and deformation, H-space.

Category : Definitions and some examples of category, factor and natural transformation. (10L)

Fundamental group and covering spaces : Definition of the fundamental group of a space, the effect of a continuous mapping on the fundamental group, fundamental group of a product space, notion of covering spaces, liftings of paths to a covering space, fundamental groups of a circle, (20L)

Universal cover, its existence, calculation of fundamental groups using covering space. Projection space and torus, homomorphisms and automorphisms of covering spaces, deck transformation group, Borsuk – Ulam theorem for S^2, Brower fixed-point theorem in dimension 2. (35L)

11: Lattice Theory-I

Introduction : Partially ordered sets, graphs, order isomorphism, Maximal minimal condition, Jordan-Dedekind chain condition, dimension function. (10L)

Definition of an algebra, Lattices as algebras, density principle, Lattices as partially ordered sets sublattices Ideals, complements, semicomplements, atoms, Irreducible and prime elements, Morphisims homomorphisims, ideals direct products. (20L)

Closure operation, Dedekind condition, Dedekind cuts. Completion, interval topology.(15L)

Distributive and modular lattices, modularity and distributivity criterion, distributive sublattices of modular lattices, transposed intervals, meet representation in modular and distributive lattices. (20L)

Paper – MS305

(Special Paper-II)

Total Lectures: 65 ***Marks: 50***

15: Viscous Flows, Boundary Layer Theory and Magneto Hydrodynamics-I

Viscous Flows

Some exact solutions of Navier – Stokes' Equations: the flow due to suddenly accelerated plane wall; the flow near an oscillating plane wall; plane stagnation point flow (Hiemenz flow); the flow near a rotating disk; Hele-shaw flow; Bodewadt flow. (18L)

Navier-Stokes equations in non-dimensional form; Reynolds number. Creeping motion; hydrodynamical theory of lubrication; Stokes's flow past a sphere and a cylinder : Stokes paradox; Oseen approximation,Oseen's solution for a sphere. (18L)

Laminar Boundary Layer Theory

Concept of boundary layer : Prandtl's assumptions. Two dimensional B.L. Equations for flow over a plane wall : Boundary layer on a flat plate ; Blasius-Topfer solution, 'Similar solutions' of the B. L. equations : B. L. flow past a wedge; B. L. flow along the wall of a convergent channel; B. L. flow past a circular cylinder; (20L)

Separation of boundary layer.

The spread of a jet :

(i) *plane free jet (two-dimensional jet),*

(ii) *circular jet (axisymmetric jet).*

Prandtl-Mises transformation :

Karman momentum integral equation. Karman – Pohlhausen method : simple applications. (9L)

16: Theory of Elasticity-I

1. Generalised Hooke's law Orthotropic and transversely isotropic media. Stress-strain relations in isotropic elastic solid. (5L)
2. Saint-Venant's semi-inverse method of solution (Statement). Formulation of torsion problem and the equations satisfied by the torsion function and the boundary condition. Formulation of torsion problem as an internal Neumann problem,. Dirichlet's problem and Poisson's problem. Prandtl's stress function. shearing stress in torsion problem. Solution of torsion problem for simple sections Method of sol. of torsion problem by conformal mapping. (30L)
3. Flexure problem : Reduction of flexure problem to Neumann problem. Solution of flexure problem for simple sections. (10L)
4. Potential energy of deformation. Reciprocal theorem of Betti and Rayleigh. Theorem of min. Potential energy. (10L)
5. Plane problem : plane strain, plane stress, generalised plane stress. Basic equations. Airy's stress function. Solution in terms of complex analytic function. (10L)

20: Advanced Operations Research-I

Non-linear Optimization : Local and global minima and maxima, convex functions and their properties, Method of Lagrange multiplier. (8L)

Optimality in absence of differentiability, Slater constraint qualification, Karlin's constraint qualification, Kuhn-Tuckers Saddle point optimality conditions, Optimality criterion with differentiability and convexity, separation theorems, Kuhn-Tuckers sufficient optimality theorem. (10L)

Unconstrained Optimization : Search method : Fibonacci search, Golden Section search; Gradient Methods : Steepest descent Quasi-Newton's method, Davidon-Fletecher-Powell method, Conjugate direction method (Fletecher-Reeves method). (15L)

Optimality conditions : Kuhn-Tucker conditions – non negative constraints (6L)

Quadratic Programming : Wolfe's Modified Simplex method, Beale's method (8L)

Separable convex programming, Separable Programming Algorithm. (6L)

Network Flow : Max-flow min-cut theorem, Generalized Max flow min-cut theorem, Linear Programming interpretation of Max-flow min-cut theorem, Minimum cost flows, Minflow max-cut theorem. (12L)

21: Inviscid Compressible Flows and Turbulence-I

Basic thermodynamics; Equations of state; Polytropic gases. Euler's equations of Motion; conservation of energy. Circulation theorem; Propagation of a small disturbance : Sound waves. Steady isentropic motion : Bernoulli's eqn. Subsonic and supersonic flows. Irrotational flow : velocity potential; Bernoulli's eqn. for unsteady flow. Stream function for steady two-dimensional motion. Steady flows through stream tubes, De Laval Nozzle. (30L)

Method of characteristics, unsteady one-dimensional flow. Normal and oblique shock relations; shock polar diagram. (10L)

Exact solution for two-dimensional steady motions : Radial flow : vortex flow, Prandtl-Mayer flows. Hodograph method : Molenbroek transformation; Legendre transformation; Solution of Chaplygine's equation. Limit lines; Linearization by the method of small perturbation : Prandtl-Glauert transformation. Subsonic and supersonic flow past thin bodies. Rayleigh-Janzen's method for flow past a circular cylinder. (25L)

23: Mathematical Modelling of Biological Systems - I

Qualitative Theory of Linear and Nonlinear systems

Linear systems: Linear autonomous systems, existence, uniqueness and continuity of solutions, diagonalization of linear systems, fundamental theorem of linear systems, the phase paths of linear autonomous plane systems, complex eigen values, multiple eigen values, similarity of matrices and Jordon

canonical form, stability theorem, reduction of higher order ODE systems to first order ODE systems, linear systems with periodic coefficients. (15L)

Nonlinear systems: The flow defined by a differential equation, linearization of dynamical systems (two, three and higher dimension), Stability: (i) asymptotic stability (Hartman's theorem), (ii) global stability (Liapunov's second method). (10L)

Periodic Solutions (Plane autonomous systems): Translation property, limit set, attractors, periodic orbits, limit cycles and separatrix, Bendixon criterion, Dulac criterion, Poincare-Bendixon Theorem, index of a point, index at infinity. (10L)

Bifurcation and Center Manifolds: Stability and bifurcation, saddle-node, transcritical and pitchfork bifurcations, hopf- bifurcation, center manifold (linear approximation). (5L)

Linear difference equations: Difference equations, existence and uniqueness of solutions, linear difference equations with constant coefficients, systems of linear difference equations, qualitative behavior of solutions to linear difference equations. (8L)

Nonlinear difference equations (Map): Steady states and their stability, the logistic difference equation, systems of nonlinear difference equations, stability criteria for second order equations, stability criteria for higher order system. (8L)

Chaos: One-dimensional logistic map and chaos. (4L)

References:

24:Advanced Numerical Analysis – I

Dynamic Modelling with Difference Equations: The Malthusian Model. Non-linear Models. Analyzing Non-linear Models. Variations on the Logistic Model. Discrete and Continuous Models. (20L)

Linear Models of Structured Populations: Linear Models and Matrix Algebra. Projection Matrices for Structured Models. Eigenvectors and Eigenvalues. Computation of Eigenvectors and Eigenvalues. (15L)

Non-linear models of Interactions: A simple Predator-Prey Model. Equilibria of Multi-population Models. Linearization and Stability. Positive and Negative Interactions. (15L)

Modelling Molecular Evolution: Background on DNA. An Introduction to Probability. Conditional Probability. Matrix Models of Base Substitution. Phylogenetic Distances. (10L)

References:

1. Mathematical Models in Biology: An Introduction: Elizabeth A. Allman & John A. Rhodes.

25: Plasma Mechanics-I

Definition of Plasma as an ionized gas. Saha's equation of ionization. Occurrence of plasma in nature. Plasma as mixture of different species of charged particles. (10L)

Elements of kinetic theory (Statistical approach), Single particle phase space, Volume elements Distribution function, Characterization of plasma with respect to the nature of the distribution function : Homogeneous, Inhomogeneous, Isotropic, Anisotropic (10L)

Derivation of Boltzmann equation, Average values and Macroscopic variables, Derivation of Macroscopic equations (Moment equations): Equation of continuity, Equation of motion, Equation of energy, Assumption on the nature of the distribution function to form a closed and consistent system of macroscopic equations (Equation of State), Cold Plasma limit, The equilibrium state:Maxwellian Distribution, Debye Shielding, The plasma parameter and the criteria for plasma formation, (15L)

Plasma-Single fluid approach (MHD): Approximation for MHD, Basic equations for MHD:, Conservation of mass, Conservation of momentum, Conservation of energy, Conservation of magnetic flux, Frozen-in-effect, Alfven theorem, Generalized Ohm's law, MHD equilibrium, The theta Pinch, The Z – Pinch, Axisymmetric toroidal equilibria , Linear Stability, The energy principle of ideal MHD, The Rayleigh – Taylor instability(15L)

First order orbit theory (Single particle motion): Uniform **E** and **B** fields, Larmor orbits and guiding centers, The magnetic moment and the magnetization current, Non-uniform **B** field, Non-uniform **E** field, Time varying **E** field, Time varying **B** field, Adiabatic invariants, (10L)

26: Advanced Fuzzy Sets and Systems- I

***Possibility Theory*:** Fuzzy measures, Evidence theory, belief measures and Plausibility measures, Possibility theory, Necessity measures, Fuzzy sets and possibility theory. (10L)

***Fuzzy Logic*:** A brief overview of Classical logic, Fuzzy propositions, Fuzzy quantifiers, Linguistic hedges, Inferences from fuzzy propositions. (15L)

***Approximate Reasoning*:** Fuzzy experts systems – Knowledge base, data base, inference engine. If-Then rules, Fuzzy implications, Fuzzy propositions in approximate reasoning. Transition Modifier rules. Basic principles and rules of inference. Fuzzy Multi-conditional approximate reasoning, Rules of inter-valued fuzzy sets and Fuzzy relation equations in approximate reasoning. (15L)

***Fuzzy Control*:** Fuzzy inference system, Fuzzification and defuzzification processes, aggregation methods, Mamdani type fuzzy controller, Takagi-Sugeno type fuzzy controller. Applications of fuzzy control to washing machine and other industrial problems. (20L)

SEMESTER-IV

Paper – MG401

Group : A

Probability Theory and Statistical Methods

Total Lectures : 40 **(Marks – 30)**

Fields and σ-fields of events. Probability as a measure. Random variables. Probability distribution. Expectation. Moments. Moment inequalities, Characteristic function. Inversion theorem. Convergence of sequence of random variables-weak convergence, strong convergence and convergence in distribution, continuity theorem for characteristic functions. Weak and strong law of large numbers. Lindeberg-Levy Central Limit Theorem. Central Limit Theorem with Lindeberg and Liapunoff conditions. (12L)

Definition and classification of stochastic processes. Markov chains with finite and countable state space, classification of states, limiting behaviour of n-step transition probabilities, stationary distribution.(7L)

Sufficient statistics, Completeness. Methods of estimation-maximum likelihood and moment methods of estimation, consistent estimators.C onfidence intervals. Tests of hypotheses: most powerful and uniformly most powerful tests, similar tests, likelihood ratio tests. Large sample tests. Simple nonparametric tests for one and two sample problems, rank correlation and test for independence.(8L) Gauss-Markov models, Estimability of parameters, Best linear unbiased estimators, Tests for linear hypotheses and confidence intervals. Analysis of variance and covariance. Fixed, random and mixed effects models. Simple and multiple linear regression. (8L)

8. *Probability*- Gredenko

Group : B

Modern Algebra-III

Total Lectures : 30 **(Marks – 20)**

Field Theory: Extension of fields, Simple extensions, Algebraic and Transcendental extensions, Splitting fields, Algebraically closed fields, normal extension, separable extensions, Perfect field. (30L)
Automorphism of fields, Galois field, Galois extension, Fundamental Theorem of Galois theory, primitive elements, Solution of polynomial equations by radicals, Insolvability of the general equation of degree five or more by radicals, Cyclotomic extensions, Ordered field, Valuation, Completion. (20 L)
Modules: Artinian and Noetherian Modules, Fundamental Structure Theorem for finitely generated modules over a P.I.D. and its application to finitely generated Abelian groups. (15L)

Paper – MG402

Group : A

Continuum Mechanics-II

Total Lectures : 40 **(Marks – 30)**

General : Body, configuration, axiom of continuity, Motion of a body. Reference configuration, deformation. Material and spatial coordinates. Material and spatial time derivatives – relation between them. Velocity and acceleration. Physical components of acceleration in general curvilinear coordinates – in cylindrical coordinates and spherical polar coordinates, Deformation gradient tensor, Reynolds transport theorem for volume property. Principle of conservation of mass – Path lines, stream lines and streak lines. Material surface. (Bounding surface). Lagrange's criterion for material surface, Polar decomposition theorem (Statement), polar decomposition of deformation gradient tensor – stretch and rotation tensors, principal stretches. Classical theory of infinitesimal deformations. Compatibility equations, Relative deformation gradient tensor, relative stretch tensors and relative rotation tensor. Rate-of –strain tensor-its principal values and invariants rate-of rotation tensor – vorticity vector; velocity gradient tensor, General principles of momenta balance; Euler's laws of motion. Body forces and contact forces. Cauchy's laws of motion: Stress equation of motion and symmetry of stress tensor for non-polar material. Energy balance – first and second laws of thermodynamics. (20L)

Constitutive equation (stress-strain relations) for isotropic elastic solid. Elastic modulii. Strain-energy function. Beltrami-Michel compatibility equations for stresses. Equations of equilibrium and motion in terms of displacement.. (20L)

Group : B

Elements of Dynamical System

Total Lectures : 25 **(Marks – 20)**

***Dynamical Systems* :** Phase variables and Phase space, continuous and discrete time systems, flows(vector fields), maps (discrete dynamical systems), orbits, asymptotic states, fixed (equilibrium) points periodic points, concepts of stability and SDIC (sensitive dependence of initial conditions) chaotic behaviour, dynamical system as a group. (6L)

Linear systems : Fundamental theorem and its application. Properties of exponential of a matrix, generalized eigenvectors of a matrix, nilpotent matrix, stable, unstable and center subspaces, hyperbolicity, contracting and expanding behaviour. (6L)

Nonlinear Vector Fields : Stability characteristics of an equilibrium point. Liapunov and asymptotic stability. Source, sink, basin of attraction. Phase plane analysis of simple systems, homoclinic and heteroclinic orbits, hyperbolicity, statement of Hartmann-Grobman theorem and stable manifold theorem and their implications. (6L)

Liapunov function and Liapunov theorem. Periodic solutions, limit cycles and their stability concepts. Statement of Lienard's theorem and its application to vander Pol equation, Poineare-Bendixsom theorem (statement and applications only), structural stability and bifurcation through examples of saddle-node, pitchfork and Hopf bifurcations. (7L)

5. Arnold – *Ordinary Differential Equations*

Paper – MS403

(Special Paper-III)

Total Lectures : 65 **(Marks – 50)**

1: Advanced Differential Geometry-II

2: Advanced Real Analysis-II

Density of arbitrary linear sets. Lebsegue density theorem. Approximate continuity. Properties of approximately continuous functions. Bounded approximately continuous function over [a,b] and exact derivative. (15L)

The Perron integral : Definitions and basic properties, Comparison with Lebesgue integral and Newton integral. (10L)

Trigonomeric system and Trigonometric Fourier series. Summability of Fourier series by (C, I), means. Fejer's theorem. Lebesgue's theorem. Completeness of Trigonometric system. (15L)

Sets of the 1^{st} and of the 2^{nd} categories. Baires theorem for G_δ, residual and perfect sets, points of condensatia of a set. (10L)

Baire classification of functions. Functions of Baire class one. Baire's theorem. Semicontinuous functions. (15L)

6. I. P. Natanson – *Theory of Functions of a Real Variable*, Vols. I & II.
7. E. W. Hobson – *Theory of Functions of a Real Variable*, Vols. I & II

3: Advanced Functional Analysis-II

Stone-Weierstrass W-capital theorem in C(X,R) and C(X,C) where X is a compact Hausdorff space, Representation theorem for bounded linear functionals on C[a,b], l_p $(1\leq p<\infty)$ and $L_p[a,b]$, $(1\leq p<\infty)$, consequences of uniform boundedness principle, weak topology, weak* topology, Banach-Alaoglu theorem. (25L)

Approximation Theory in Normal Linear space, Best approximation, Uniqueness Criterion, Separable Hilbert Space. (15L)

Banach Algebra, Identity element, analytic property of resolvent Operator, Compactness of Spectrum, Spectral radius and Spectral mapping Theorem for polynomials, Gelfand Theory on representation of Banach Algebra, Gelfand Neumark Theorem. (25L)

4: Rings of Continuous Function-II

Partially ordered rings, convex ideals, absolutely convex ideals, properties of convex ideals, lattice ordered rings, total orderedness of the residue class rings modulo prime ideals in C(X) and $C^*(X)$, real ideals, hyper-real ideals in C(X). Limit ordinal, non-limit ordinals, compactness of the spaces of the ordinals, first uncountable ordinals space and its "one point compactification" and relation between the rings of continuous function on them, Characterization of real ideals.(20L)

Cluster point and convergence of Z–filters on a dense subset of a Tychonoff space. Characterization of C^*-embedded dense subset of a Tychonoff space. Construction of Stone-Čech compactification. More specific properties of βN and βQ and βR.(15L)

Characterization of maximal ideas in $C^*(X)$ and C(X). Gelfand-Kolmogorov theorem. Structure space of a commutative ring - another description of βX. The Banach-Stone theorem.(15)

Partial ordered set K(X) of the T_2 Compactifications of a Tychonoff space X, elements of K(X) and the subsets of $C^*(X)$. Local compactness and the complete lattice K(X).(15L)

6: Non Linear Optimization In Banach Spaces-II

Tangent Cones-Definition and properties. Optimality Conditions. Lyusternik theorem.

Generalized Lagrange Multiplier Rule – Problem formulation. Necessary and Sufficient optimality conditions. Application to optimal control problems. (20L)

Duality-Problem formulation. Duality theorem. Saddle point theorems. Linear problems. Application to approximation problems. (15L)

Some special optimization problems-Linear quadratic optimal control problems. Time optimal control problems. (30L)

Paper – MS404

(*Special Paper-IV*)

Total Lectures : 65 **(Marks – 50)**

15: Viscous Flows, Boundary Layer Theory & Magneto-Hydrodynamics-II

Electromagnetic equations for moving media, Ohm's law including Hall current, Lorentz force. MHD approximations. Stress-tensor formulation of Lorentz force; frozen-in-magnetic field. Alfven's Theorem;

Alfven waves. Equations of motion and induction; their nondimensional forms; dimensionless parameters, Lundquist's criterion. Energy equation : Viscous and Joule dissipation, Poynting theorem. Boundary conditions. (25L)

Steady viscous incompressible flows : unidirectional flow under a transverse magnetic field : decoupling of MHD equations. Hartmann flow; Couette flow. Flow through a rectangular duct. Unsteady incompressible flows. Rayleigh's problem. MHD waves : propagation of small disturbances; plane waves; Reflection and transmission of plane harmonic waves; existence of finite amplitude MHD waves. Alfven waves with ohmic damping; Skin effect. (25L)

Magnetohydrostatics; equilibrium-configurations, Pinch effect, force-free fields, non-existence of force-free field of finite extent. General solution for a force-free field, special cases.

Dynamo problem, Cowling's theorem, Ferraro's law of isorotation. (15L)

16: Theory of Elasticity-II

Vibration problems : Longitudinal vibration of thin rods, Torsional vibration of a solid circular cylinder and a solid sphere. Free Rayleigh and Love waves. (15L)

Thermoelasticity : Stress-strain relations in Thermo elasticity. Reduction of statistical thermo-elastic problem to a problem of isothermal elasticity. Basic equations in dynamic thermo elasticity. Coupling of strain and temperature fields. (30L)

Magneto-elasticity : Interaction between mechanical and magnetic field. Basic equations Linearisation of the equations. (20L)

17: Elasticity and Theoretical Seismology-II

Theoretical Seismology

Theory of elastic waves; Motion of a surface of discontinuity – kinematical condition and dynamical conditions. Kirchoff's solution of inhomogeneous wave equation. (20L)

Reflection and refraction of elastic body waves. (10L)

Surface waves : Rayleigh, Love and Stonely waves (10L)

Dispersion and Group Velocity of elastic body waves. (10L)

Some problems : Application of pressure and twist on the walls of a spherical cavity in an elastic medium. (10L)

Line source and point source on the surface of a semi-infinite elastic medium. (5L*)*

18: Applied Functional Analysis-II

Semigroups of linear operators-general properties of semigroups. Generation of semigroups. Dissipative semigroups. Compact semigroups. (20L)

Holomorphic semigroups, Elementary examples of semigroups. Extension. Differential Equations. Cauchy Problem, Controllability. State reduction. Ovservability. Stability and stabilizability. Evolution equations. (30L)

Optimal Control Theory-Linear quadratic regulator problem. The same problem with infinite time interval. Hard constraints. Final value control. Time optimal control problems. (15L)

19: Quantum Mechanics-II

Collision Theory *:* Basic concepts, Cross sections, Laboratory and center-of-mass coordinates, Rutherford scattering, Quantum mechanical formulation — time independent and time-dependent, Scattering of a particle by a short-range potential, Scattering by Coulomb potential, Scattering by screened Coulomb field, Scattering by complex potential. (15L)

Integral Equation Formulation: Lippmann-Schwinger integral equation and its formal solutions, Integral representation of the scattering amplitude, Convergence of the Born Series, Validity of Born approximation, Transition probabilities and cross sections. (12L)

Semi-Classical Approximations : WKB approximation, Eikonal approximation. (8L)

Variational Principles in the Theory of Collisions : General formulation of the variational principle, Hulthen, Kohn-Hulthen and Schwinger variational methods, Determination of Phase shifts, Scattering length and scattering amplitude for central force problems, Bound (minimum) principles. (20L)

Analytic Properties of Scattering Amplitude : Jost function, Scattering matrix, Bound states and resonances, Levinson theorem, Dispersion relations, Effective range theory. (10L)

20: Advanced Operations Research-II

Dynamic Programming : Characteristics of Dynamic Programming problems, Bellman's principle of optimality (Mathematical formulation)

Model –1 : Single additive constraint, multiplicative separable return,

Model – 2 : Single additive constraint, additively separable return,

Model – 3 : Single a multiplicative constraint, additively separable return,

Multistage decision process – Forward and Backward recursive approach, Dynamic Programming approach for solving linear and non-linear programming problems, Application – Single-item N-period deterministic inventory model. (25L)

Geometric Programming : Elementary properties of Geometric Programming and its applications. (8L)

Queuing Theory : Introduction, characteristic of Queuing systems, operating characteristics of Queuing system. Probability distribution in Queuing systems. Classification of Queuing models. Poisson and non-Poisson queuing models (32L)

21: Inviscid Compressible Flows and Turbulence-II

Turbulence:

Introduction. Reynold's equations of mean motion for turbulent flow, Reynold's stress-tensor; eddy viscosity. Phenomenological theories. Mixing length Prandtl's momentum transfer theory, Taylor's vorticity transfer theory. Karman's similarity hypothesis. Velocity distribution in channel flow under constant pressure gradient. (30L)

Spread of turbulence: Mixing zone between two parallel flows, (two-dimensional) turbulent wake behind (i) symmetrical cylinder (ii) a row of parallel rods. Turbulent flow through smooth circular pipes; Seventh power velocity distribution law; turbulent boundary layer on a flat plate. (20L)

Statistical approach; Introductory concepts; double correlation between velocity components, longitudinal and lateral; correlations in homogeneous turbulence; Eulerian correlation with respect to time, Taylor's one-dimensional energy spectrum. Energy relations in turbulent flows. (15L)

References:

5. *J. A. Shercliff: A text Book of Magnetrohydrodynamics*
6. *V. C. A. Ferraro and C. Plumpton: An Introduction to magneto fluid Mechanics, Oxford Univ. Press, 1961.*

22: Computational Fluid Dynamics-II

Multigrid method, Conjugate – Gradient method. Incompressible Navier – Stokes (NS) equations – Boundary conditions, Spatial and temporal discretization on collocated and on staggered grids. Development of the MAC Method for NS equations, Implementation of boundary conditions. (35L)

Grid Generation by Algebraic mapping : One-dimensional stretching functions, Boundary – Filted Coordinate Systems : Elliptic Grid generation. Solution of Euler Equations in General Co-ordinates. Numerical Solution of NS Equations in General Co-ordinates. (30L)

23: Mathematical Modelling of Biological Systems-II

***Models for Molecular Events*:** Law of mass action, basic enzyme reaction, the quasi-steady-state assumption and its consequences, validity of the quasi-steady-state assumption, motion kinetics, cooperative kinetics, stability of activator –inhibitor and positive feedback systems. (12L)

***The Chemostat Model*:** Bacterial growth in a chemostat, formulation of the cheomostat model, stability analysis of the steady states, construction of phase-plane diagram, saturating nutrient consumption rate (Monod model). (10L)

***Diffusion Model*:** The general balance law, Fick's law, diffusivity of motile bacteria. (8L)

***Models for Developmental Pattern Formation*:** Background, model formulation, spatially homogeneous and inhomogeneous solutions, Turing model, conditions for diffusive stability and instability, pattern generation with single species model. (10L)

***Models of Biological Oscillators*:** Oscillation in chemical systems, Goodwin's model, its stability and oscillations, simple two species oscillators- parameter domain determination for oscillations. (10L)

***Models for Population Genetics*:** Introduction, basic model for inheritance of genetic characteristic, Hardy-Wienberg law, models for genetic improvement, selection and mutation- steady state solution and stability theory. (10L)

References:

1. Modelling Dynamical Phenomena in Molecular Biology: L.A.Segel.
2. Mathematical Biology: J.D.Murray.

25: Plasma Mechanics- II

Vlasov – Boltzmann srlf-cosistent equations in collision less plasma. Plasma Oscillations. Landau. Damping. (10L)

Waves in Plasmas : Waves in warm field free plasma : Dielectric Tensor and general dispersion relation – High frequency approximation & Low frequency approximation. Waves in cold homogeneous magneto plasma : Dielectric Tensor and general dispersion relation, Cut – Off & Resonance, Group Velocity, Wave normal surface, Refractive Index, Refractive Index Surface. (15L)

Different types of wave modes for different types of approximation. Waves in warm homogeneous magneto plasma : Dielectric Tensor and general dispersion relation, Two fluid Model, Single fluid model, Two stream instability. Characterization of different waves in plasmas : Electron waves (electrostatic) : Plasma Oscillations, Upper hybrid Oscillations, Ion waves (electrostatic) :Ion-acoustic waves, Ion-cyclotron waves, Lower hybrid Oscillations, (15L)

Electron waves (electromagnetic) : - Light waves, O waves, X waves, R waves (whistler mode), L Waves, Ion waves (electromagnetic) : - Alfven wave, Magnetosonic wave(6L)

Nonlinear wave processes in plasma: Derivation of KdV-ZK equation for ion-acoustic wave & Alfven, wave and their soliton solution. (8L)

Applications: Space Plasma, Solar Plasma, Gravitational Plasma, Laboratory Plasma, (6L)

Paper – MT405

Term Paper

Marks: 50

Term paper MT405 is related with the special papers offered by the department in each session and the topic of the term paper will also be decided by the department in each session. However the mark distribution is20 marks for written submission, 20 marks for seminar presentation and 10 marks for viva-voce.

END
